

Operation of “First Class” machine

1. Add an approved product that has been accurately mixed to the correct ratio into the bowl or bowls of the machine. This product must contain a brix level of at least 20%. If you are unsure then do not attempt to slush.
2. Switch on the machine with the green power switch on the left hand side. Wait for a few moments while the machine initializes.

3. Press the spiral auger button on the right hand side to start the mixer turning. (each bowl has its own display and keypad)

“Auger on”

4. Now press the diamond “motor on” button to start the “chill” function.

“Motor on”

5. You will now have the droplets displayed. This is the chilled drink function.

“Cold Drinks”

Use the up and down arrows to select the cold temperature you desire 2,3,4 or 5 (5 is the coldest)

6. Press the diamond “motor on” button again to select the “slush” function.

“Slush”

The display will now say “Auto setting” this is the machine calibrating itself for slush production the lid light will flash on and off. Once the calibration is complete the display will read “Slush” the lid light will stop flashing.

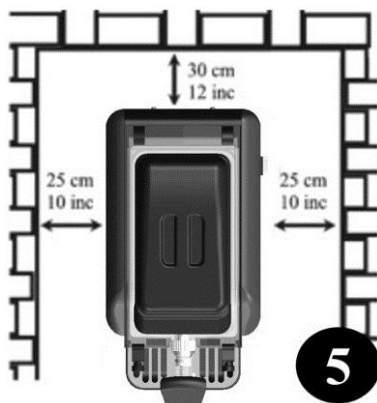

To adjust the product density, use the up and down arrows to achieve the consistency you require 1 – 9. (7 is usually the best)

PTO

- Do not attempt to “Slush” a product that is unsuitable as this will cause ice to form. Squeaking, juddering and other unusual behaviour are symptoms of low brix levels in an unsuitable product.
- Do not switch off the machine for long periods when full of slush as this will allow ice lumps to form and will damage the machine if switched back on before the ice has fully melted. (If you are leaving product in the machine overnight then use the “Chill” mode and leave the machine running, alternatively empty the machine!)
- Never add lumps of ice to the machine.
- Do not attempt to scrape off ice forming on the outside of the machine or clean the bowl with anything other than a soft cloth and warm water.
- Ensure adequate ventilation, never block or restrict the vents around the machine, do not place close to walls or another heat source.
